CHRIS: Did you ever find out where the oil was going in your engine? It looks like you added one less quart during this run, which makes the reductions in wear even more impressive. Aluminum and iron are both lower after a similar oil run, so there are no signs that the oil consumption is due to a mechanical issue like a ring problem in your engine. The higher sodium we found last time is washing out like we'd hoped, so coolant isn't a worry here either. This engine will do fine with a longer run based on these results. Be sure to keep the oil topped off and check back in 8K miles.
